Culture of Glads

PLANTING—Gladioli may be planted any time the ground is in good condition. Large bulbs should be planted five to six inches deep. Smaller bulbs less, about three inches for quarter-inch. The roots go down; therefore ground should be well pulverized and enriched below as well as above the bulbs. No fresh manure should come in contact with the bulbs.

They should have full exposure to sun and will not give best results if planted in the shade or where the roots of trees or shrubbery sap the ground. Do not expect to get good results where you could not raise a good hill of potatoes.

CULTIVATION—Cultivation should be constant and may be begun by raking before the shoots appear. Do not let a crust form around the plants. Gladioli are good feeders and will utilize large amounts of old manure worked into the ground through the season. The new bulbs and bulblets are formed after blooming, so cultivation should be continued for five or six weeks after bloom is cut. If water is given, a thorough soaking once a week is better than a little once a day. A mulch of lawn clippings or other fine material helps to keep the ground cool and conserves moisture but is no substitute for cultivation.

Cultivation kills weeds. Proper cultivation conserves moisture. Cultivation enables the air to change the soil to plant food. Do not forget to cultivate.

DIGGING—After tops are killed by frost, bulbs should be dug and tops cut close to bulb. Dry for one or two days in the sun and separate bulblets from bulbs. Bulbs should be kept cool and dry in ventilated crate or basket. They will keep well in conditions favorable for potato storage. Where ground does not freeze, bulbs may be left in, but is not recommended to do so.

BULBLETS—The little offsets found around the parent bulb at digging time are called bulblets or cormels. They are always true to the parent bulb, and bulbs that please you should be marked and staked that the increase may be saved separately, and your stock propagated from these. Contrary to many peoples notions and some published articles, gladioli do not mix by being planted together and do not run out. A mixture planted for several years will change its proportions by natural division and death of less hardy varieties.

Bulblets should be kept in dry earth or sand during winter. Plant 100 to 200 to the foot in a trench the width of a hoe and cover two to three inches deep. Ground should be in the best possible condition. Soaking twenty-four to forty-eight hours in tepid water before planting improves germination. Sixty per cent is considered fair germination if planted unpeeled.

Please Note

All bulbs offered in this catalog are of excellent quality and will produce blooms the first season.

REMITTANCE—May be made by Express Money Order, P. O. Money Order, check or cash.

TERMS—All orders accompanied by remittance will be sent PREPAID. Thirty days' credit will be allowed to customers of approved financial standing.

Place Your Orders Early

It is well to place your order as early as possible as some varieties are in limited supply and can be furnished only for a short time. Orders are filled in the same rotation as received.

Bulbs quoted singly or by dozen are sent anywhere prepaid. Larger quantities are quoted F. O. B. Des Moines, Iowa.

Orders under \$10.00 are cash. Orders for more than this amount will be held until March 1, 1926, for a 25 per cent deposit and shipped when wanted, C. O. D. for balance.

We exercise the greatest care to furnish only highest quality bulbs, but give no warranty, express or implied, as to description, quality, productiveness or any other matter of any bulbs sent out, and will not be in any way responsible for the crop other than replace bulbs untrue to name. Orders are accepted only on these terms.

A Message to Gladiolus Lovers

WHEN we held open house, one Saturday afternoon of last August, at one of our fields, where thousands of gladiolus blooms were given away to the hundreds of visitors attending, we were greatly gratified by the way they unanimously voiced their admiration and amazement at the great selection of beautiful varieties exhibited.

At the Midwest Gladiolus Show, held at the Iowa State Fair and Exposition, in the end of August, we were happy to have our blooms play the most important part in the exhibit by the Iowa Bulb and Flower Growers' Association. First prizes were awarded to our flowers in the following exhibits:

Largest exhibit basket, made up of "A. W. Hunt."

Large basket made up of "Marshal Foch."

Large basket made up of "Mrs. H. E. Bothin."

Individual exhibits, too numerous to recount, received awards.

The Gladiolus is now a great factor in any gardening scheme, and the demand is greater each year. The remarkable gain in popularity which this wonderful flower has made in recent years is due in a large measure to the appreciation it has won in the minds of flower-loving people, as a cut flower and as a garden flower. The easy culture appeals to all and there is no other flower that gives such a limitless array of color and shade of colors.

You cannot get any plants more profuse in color while bloom, nor can you find any flowers superior for cutting. Sprigs placed in water will bloom for weeks at a time, while those in the garden will flourish over a long period.

Instructions for Planting Gladiolus Bulbs

Gladioli are very easy to grow and will do well in almost any ordinary garden soil. If planted in the richest place in the garden and given plenty of sun and moisture, they will, however, repay you with extra-large blooms and gorgeous colors.

To obtain a continuation of blooms during the greatest part of the season, it is advisable to plant at intervals of ten days, from the middle of April until the end of June.

Plant the bulbs 4 inches deep in heavy soil and 5 or 6 inches deep in light soil. To get your soil in good condition it will be necessary to spade deep and pulverize thoroughly. It is preferable to work in stable manure in the fall if possible. If not, it is advisable to use fertilizer or bone meal in the spring, such as is used for growing potatoes, being careful to mix the fertilizer well with the soil so that the bulbs will not come in direct contact with it.

Many people make the mistake of planting the bulbs too shallow, making it necessary to stake or tie up the flowers during the blooming time. This will not be necessary if our instructions for deep planting are followed.

We shall be very glad to have you visit our fields during the blooming season. Our fields are at their best during the last of August and up to the middle of September.

We shall also be glad to furnish you with any other information you may require to grow Gladioli successfully.

Retail Price List 1925-26

A. W. Hunt

No.	Name of Description and Variety	Each	Doz.
18.	CAROLINE ESBERG (D 1921). Most vivid flame, scarlet red. No markings except fine crimson stripe through center of lower petals	2.00	20.00
